CHOMARAT 75

of M. Nostrodame.

the coniunction of the Sunne into Saturne, it doth signifie cloudye and mystie dayes, with thunder, hayle, tempest, and whirlewynds. And toward the ende of this moneth, it shal be mixed with heate, and temperate with much constancie.

The last quarter shal be the .xxxj. day after mydnight. i. minutes, wyndie, and raynes, whote, the Sunne beyng at .xxvij. minutes, and .xlii. degrees of the signe of Cancer, whiche shal be whote and drye, continually increasing with heate. Mars and Mercurius doe prognosticate some waters, and mutation of weather, the weather shal tende to some clerenesse & temperature, not without thunders and lightnyngs, and wonderfull actes of the same besides.

The Declaration of Iune.

The newe Moone shal be the .viij. day of this moneth at .v. of the clocke .xxviij. minutes in the morning, thunder with great heate and drynesse, wyndes shal blow, tending to great beheuencie of heate, that it shal seme to burne mens faces, and the most part of the goods of the earth, namely in Italy, Spayne, Prouence, and other partes of Languedock. Other regions dratyng to the west shal also haue many greate raynes, thunder and tempest.

The first quarter shal be the .xiiij. day at .viij. of

A Prognostication

the clocke. *xxiii.* minutes at after none, weather rainy, intermingled with Triplicite aquati, that shall make to appeare in the element thorough the drynesse of the Sp:ying tyme certaine beastes, as caterpillers of the one side, and on the other side Locustes and Grasshoppers, that shall doe great harme. Many Forrestes shall be lefte without greene leaves: there shall be nothing but flaming heates, whiche will cause continuall Feuers, deprivation of witte, much fransnesse: and divers other sicknesses. Lette vs pray vnto the omnipotent God to preserve vs from all these evils.

The full Moone shall be the *xxi.* day after mydnight. *xxii.* minutes: the weather very constant & moderate, but shall not long continue. After this, through great variation of the tyme, towards the west countrey the mists shall be but of smal continuance, and then the weather shall be altogether moderate.

The last quarter shall be the *xxii.* day at *.iii.* of the clocke at after none, whote, rayne, and great heates and drynesse, the Sunne being at *.xii.* degrees in the signe of Leo, that shall be whote and drye, with whote wyndes, being somewhat westerly, by the resolution of the Planets, redounding til the Sp:ying tyme shall passe. The constitution of the tyme shall be altogether lyke, without any difference, and the Sunne shall little diminish
the

of M. Noſtrodame.

the coniunction of the Sunne in Iupiter, which
ſhal be the occaſion of ſome wind. But truly there
ſhal be great thunders and horrible tempeſts, with
haille that ſhall fall. The ayre ſhal become ſo darke
and obſcure, that it ſhall ſeeme altogether blacke,
as it were nyght, for a certayne time and ſpace.

The Declaration of Iuly.

The nexte Moone ſhal be the .vi. day of this
moneth. .lv. minu. after mydnight, thun-
ders and lightnings, with gret tempeſts.
An vniuerſall conſtitution of the yeare
is here Comprised with diuers other agree-
mentes. For the coniunction of this yere prognosticateth,
bycauſe it is a ſigne of furie and vnnaturall, that
all manner of ſedyng flockes ſhall ſuffer through
mortalitie and other inconueniences. The rayne
ſhall greatly abounde, & there ſhal not be ſo much
increaſe as it ſhall ſeeme to appere vpon the earth:
but of all maner of oyle great abundance.

The ſyde quarter ſhal be the .xiiij. day at .iiij. of
the clocke. .xxii. minutes in the mo:nyng, the wea-
ther freſhe, conſtant, and moderate, by reaſon that
the Dogge dayes ſhal be ſuperiours. There ſhal be
a mutation of weather: for at the dayes of they:
entie, there ſhal be great change of cold, and ſhall
be the generall occaſion of dyuers kynde of conti-
nual ſerene quietnes.

A Prognostication

long sicknesse, whiche shall long endure.

The full Moone shall be the .xxi. day at .iij. of the clocke .x. minutes in the morning wyndes, haile, thunders, very tempestuous : also sicknesses and diseases shall be augmented in the same tyme. The ende of this moneth shall be very raynie : then in a short tyme the heate shall augment. Agayne, there shall be thunder and lightning, haile and tempest, weather contagious and very inconstant for the space of many dayes.

The last quarter shall be the .xxix. day at .iij. of the clocke .xv. minutes in the morning, abundance of heate, being peruerse : but by all other planets it appereth not to be very good, the weather shall so feruently be inflamed, that all shall seeme to dry up at once. But because that the Moone doth lengthen hir selfe from the Sunne, tending to the full, it doth foreshew some dayes to be somewhat cold : through impetuous shoures of rayne there shall be thunders and tempest towards Italy, and the most part of Spayne. There shall be certaine sicknesses of plagues : and some shall sodainly be depriued both of wit and sense at once : diuers shall ouerwhelme them selues, other throw downe them selues out of windowes : some other, drowne them selues in welles, in riuers, and in ditches : there shall be many murtheres & robberies both in cities & hygh wayes, and in home shall

depend abolition. Cases ſhall be committed as well by a barbarous hande, as by a Latine : and all this to be moſte in this moneth, as it is to be ſeene by the demonſtration of the authoꝝ.

The Declaration of Auguſt.

The new Moone ſhall be the .iiii. day of this moneth at .vij. of the clocke .xxxix. minutes at after noone, the weather moderate and fayre, the Sunne beyng at .xv. degrees in the Signe of Virgo, whiche will make it (foꝛ certayn dayes) rayne and windie. This new Moone ſhalbe vnto the laſt quarter very whote : and the latter end thereof ſhal be foggie and ful of ſhoures, inconstante, with hayle, winde, colde, thunder, and lightning. Here ſhal be great wyndes, partly ſouth, partly weſt : and the vnconſtancie of the weather will be ſuche, that it ſhall not be much to be lyked. The planets doe here foꝛſhewe, that children of .vi. yeares old (but ſpecially of the woman kynde,) and yong folkes ſhall be ſoze hyſted. There ſhall be pernicious windes, which ſhall do great hurte. Let vs pray vnto GOD to defend vs from all aduerſitie.

The ſecond quarter ſhal be the .xi. daye at .iiii. of the clocke .xxvij. minutes after noone, weather inconstant and windy, with lightning very dangerous : the courſe of many ſickeſſe and diſeaſes

B. iij.

ſhal

A Prognostication

Shal be great, and of euill effect.

The full Moone shal be the .xix. day at .vi. of the clocke. liij. minutes after none, moderate weather, with litle heat. The Sommer shalbe of mcrely temperature, beginning somewhat to decline. But the Planets shal retorne agayne, and moue them selues abundantly, vntill the end of this moneth: so that by this meane, one moneth shal (in propertie) succede an other. The trees shal be leste bare, and without leaues. The fruites that shal be to be gathered, shall not continue long in theyr goodnesse. Agayne, through sodayn rayne that shal fall, Corne shal be greatly endamaged: so that it shall turne to the great losse of the people. Moreover Mars commeth on the other syde, and threty-neth, beyng moued in his effectes, as well by sea as by land: although that by the tve other shal be great emotions, sodayn, and fearefull: in such sort that that whiche was stayed, in this moneth shall come to burst out of his nest.

The last quarter shal be the .xxvii. day at one of the clocke .xv. minutes at after none, weather cold and dry, effectual to many kynde of diseases, pealow jaundise, quaterne agues, and other more. The celestiall appearance doth foreshew, moderation of tyme, but it shall not be withoute much trouble, from the ende of this moneth vnto the .xi. of the other. Som great Princes (being enimies) shall

of M. Noſtrodame.

ſhall be made friends, yet neither ſeyng nor touchyng one an other: although that the aboue ſayd Planets do make ſignification of ſome one great Potentate which will not permitte ſuche an agreement to come to ſo good effect, though al the reuolution of this moneth. I would here make a particularitie of ſome other poynt, which in orde cannot be brought but to one ſpeciall poynt, where as euery one might be pacified: but the foresayd planet or author doth prognosticate, by furious threates, moſte horrible plagues, earthquakes, and other moſte fearefull tempeſtes. Let vs praye vnto God, that ſuche evils (as here be foreſhewed vnto vs) may by moſt ſpedy repentance, be turned away from vs all. Amen.

The Prediction of September.

The new Moone ſhall be the thirde day of this moneth at .iij. of the clock. xxxvii. minutes in the morning, haile and thunder with ſmall ſhoures, the Sunne beyng at x. degrees in the ſigne of Libra, dothe promiſe vs gentle raynes tending to good ſucceſſe: but hereafter on the .vi. day beyng vnder the Planettes, is ſignified many & diuers ſickneſſes: and bycauſe that the wynde ſhalbe Eaſterly, it ſhall make contention and ſtrife, diſcention, hatred, and greate diſcord amongeſt ſome of the moſt greate. There ſhall be

A Prognostication

shall be a great temperature in the aire & wether. Venus promyseth vnseasonable weathers, with lightnynges and thunders, but it shall be for fewe dayes.

The fyyst quarter shall bee the .x. day at .viij. of the clocke .ij. minutes in the moorning, moderate and constant weather. Saturne and Venus appo- chynge vnto the Sunne, in the Equinoctiall lyne, smityng one an other, doe prognosticate rayne, cold wyndes, thicke mystes: and they forshew the disposition of the weather to bee inclined moze to colde than otherwise.

The full Moone shall be the .xxviii. day at .x. of the clocke .xxxiij. minutes in the moorning, rayne and fainte heates. Afterward, there shall be strange mutation, as well of the constitution of the weather, as of diuers people. Vnto the end of this present moneth, there shall be nothing but cold, frost, rayne, mystes, and drouth in diuers regions.

The last quarter shall be the .xxv. day at .ix. of the clock at after noone .xi. minutes, rayne and foggy, cold and drye. The cold shall begyn to be short and sharpe: but the rayne shall be troublesome, wyth lightnyng, thunder, fogges, and wyndes, mutable weather, and very inconstanc. Within the circuite of this moneth there shall be (in great varietie from the begynning vnto the latter ende) a demonstration by the authoꝝ, of the diuersitie of wyndes,

of M. Noſtrodame.

wyndes. In many places enterpriſes as well by ſea as by lande, chiefly toward the ſouth and eaſt partes. By the calmneſſe of the ayre ſhal be many ſweete ſhoures. In one of the greateſt cities ſhall be wonderfull ioye and gladneſſe, but truely toward theſe partes aforeſaid, ſhall be greate and vehement heates.

The Declaration of October.

The newe Moone ſhall be the ſecond day of this moneth at one of the clock. xxviii. minutes at after noone, tempeſtuouſ wynde and horrible. The Sunne being at. xix. degrees of the ſigne of Scorpius, which ſhall be very whote: yet ſeaſonable by reaſon of many ſhoures, and runnyng waters, with ſome myſtes & thicke fogges. It ſhalbe inconstant wether vntill the xxi. of this moneth. The wether ſhalbe very peaccable by the reaſon of moderate and ſeaſonable motions of the ayre. And as for terreſtriall and humayne doings, I fynde them variable, with many aduentures, by the inclination of the planets, that no tongue can expreſſe, or penne deſcribe.

The fyrſt quarter ſhall be the. x. day at. ij. of the clock. xxvi. minutes in the moynyng, dyuers wether and troubleſome. The moſt part of this moneth ſhal be of a good operatiō: hauing ſome ſhoures of rayne, wynde and inconstancie of wether,
tendyng

A Prognostication

tending more to freshnesse and droughte in other weather. Mars shall be occasion of great perturbation in the ayre, with great thunders and lightnings, and much inconstant weather, being very diuers for many dayes.

The full moone shall be the. xlii. day at. ii. of the clock. xxij. minutes in the morning. Therof shall be an Eclipse, with moderate and constant weather. This Moone shall be inclined to cold and drynesse with wyndes, rayne, and fogges, whiche shall engender reumes, and other sicknesses, namely many long quaterne agues, in suche sort, that many shall seme rather to dye than to lyue. The Mercurialistes were neuer in so greate trouble, as they are like to be, and that for a long tyme. Venus & Mercurius prognosticate, the one, that one end of the moneth shall be very troublesome, and the other, very difficult to passe. The wayes shall be founde greatly difficult. The signes of plague toward the ende of this moneth, shall be altogether vanished awaye. But the preparations of other long sicknesses is at hand, which shall make people (willyngly) to throw them selues bothe in fire and in water. Iupiter doth agayne prognosticate, that we shall haue the weather obscure and darke, but not so beheement as the aforesayde shall be: onely that toward the ende of the moneth, by the meanes of the malignant quadrature of Saturne, it shall
not

of M. Noſtrodame.

not be good to be lette blood, neither yet to take bathes, bycause the ſickenelles that are to come, might be pꝛeuented.

The firſt quarter ſhall be the .xxv. day at foure of the clock. xvi. minutes in the moꝛnyng, colde, wyndie, and drie, with froſtes. And as foꝛ the conſtitution, it ſhall be of the ſame temperature. And bycause that the planets towarde the ende of this moneth, do declare things truly to come to paſſe, they deſerue prayſe. There ſhall be ſay they a darkneſſe vpon the earth, dangerous wynds, flames of fyre, great raynes, and ſtoꝛmy weather, inclined to catharres, ſoreneſſe of the ſtomacke, inflammation of the plagues, and other kynde of ſodayne death.

The Prediction of Nouember.

The new Moone ſhall be the firſt day of this moneth at .ii. of the clock. iiii. minutes in the moꝛnyng, myſtie weather and troubleſome with ſnow, the Sunne beyng at .r. degrees in the ſigne of Sagitarius, by the which there ſhall myſtes, winde, and raime appeare, very inconstant and of great variation. The cold ſhall begyn to be very ſharpe, but chiefly towarde the nyghtes. And bicauſe that Iupiter and Mars doe ioine the demetrially, that that is of the leaſt conjunction, is an ample ſignification of ſome greate corruption of the ayre, ſeeming rather pꝛeſent, than
to come,

A Prognostication

to come, which shall be by raine and snow, plagues and other diseases. And because that in the diametrical conjunction, Fortune is constituted in temperate signes.

The first quarter shall be the .vij. day at .x. of the clocke .liiii. minutes at after none, raine wether and windie, being exempted of the most parte of all cold and drynesse. This moderation of wether shall be some part, conuerting it selfe to frost and drye, snowe and yce, fogges, and other kynde of malignant wether, & some snow shall begin to fall the .xix. day of this moneth. The moste parte of the wether doth prognosticate more drynesse than colde. The constraints that appeare amongst those (whereof Mercurius shall haue domination) shall haue great power. Iupiter doth foreshewe by his naturall qualities, mists, snowes, frostes and diuers wethers, inclined to many malignant sicknesses of catharres, and todayne Apoplexies in the throte, scalding heates, distillation of the raines, vpon the stomacke, vpon the kydneys, vpon the breast, and vpon the tongue, whiche wyl be very dangerous.

The full Moone shall be the .xviij. day at .liij. of the clocke .xxxi. minutes at after none, very constant and moderate weather, yet some raine. The signe of Mercurius doth prognosticate health amongst people; The cold shall waxe more and more: there shall be

of M. Nostrodane.

Shall be frostes, windes, snowe, mistes, and other diuersitie of weather very euill. The malice of this moneth shall destroy the coꝛrupt putrifaction, that would haue hapned, as woꝛmes, caterpillers, graſhoppers, and diuers other kynd of vermines. The sicknesſes shall be of ſuche ſtrangenesse, that many shall haue no skill therein, beyng both ſodeyne and dangerous.

The last quarter shall be the .xxij. day at .xj. of the clock .xxv. minutes in the moꝛnyng, froſte and ſnow, the wether shall be very dyuers ſoꝛ certayne dayes. The end of the moneth shall be little moderate, reſeruyng alwayes the colde and moyſtneſſe. Generall malice, abundance of reumes and catarres, ſoreneſſe in the ſyde, grieſe in the toyntes, and other ſickneſſes (that thꝛough colde) shall procede. The moſte of thoſe (on whom Mercurius had dominion) shall haue the power and effect, both of the Sunne and of the Moone, withholden from them. In the course of this quarter, shall reigne many euils, as bometyng of bloud, ardent agues, great aches in the ſides, ſpetyng of bloud, impoſtumes beyng ſecrete in the body, great aches in the raynes, the bloody fire. There shall be much murther that shall come to knowledge. The fluddes shall greatly abounde, not without greate hurte and loſſe. There shall aryiſe many catharres, which shall ſtuffe people, takyng them in the thꝛote and necke, that ſcarcely they shall be able to open theyꝝ mouth

A Prognostication

with instruments. The daunger vpon the sea shal somewhat be appeased.

The new Moone shall be the last day at .v. of the clock. rrriii. minutes at after none, thicke mistes and harde frost. The Sunne beyng at. r. degrees. rrv. minutes in the signe of Capricornus demonstrateth, to be a litle seasoned with moderation of weather, vntill the fyyst quarter of the next moneth folowynge: and that throughe the malignant aspectes, which be of a perfect enimitie, and manifested by certayne vayne enterpryses of some, beyng imprudent. In this present moneth, the disposition of sickneses, the ayre shal be very cloudie and colde, and of an extreme humiditie: and then sodainly all drythe. And by reason that within a while after, Saturne not lengthning him self farre from the Moone, commynge to the opposition of the Sunne, shall cause great damage, by vehemencie of wyndes, byngynge with them frostes, snowes, yce, raine, mistes, and al other diuersitie of yll weather. Saturne and the Sunne, notwithstanding the force of their oppositions througoute all the moneth, shall helpe nothing but ioy and gladnesse. Many of high estates shall be gathered together, & there shall be coniunctions and coucnantes made an ende of. Create number of sickneses, deame, reumes infinite: also catharres, and distillation of vyne, and other euill diseases very inconstant and daungerous. Let vs pray to God to preserue vs all. Amen.

of M. Noſtrodame.

The Prediction of December.

The firſt quarter ſhal be the .viij. day of this moneth at .vj. of the clocke. .xlviij. minutes at after none, tyme mutable and inconstant, tending vnto a very euill weather, ſnowe, raine, froſte, and all manner of impetuofitie, of that, that is concerned in the ayre, and it ſhall be as halfe an eſtuation, that ſhall be greatly hurtfull and noyſome. A little further it ſhall be a greate deale moze moderate and ſeaſonable, but in all this quarter ſhall be rayne and winde, weather very troubleſome. The moſt part of enimities and quarels ſhall be appeaſed and pacified, which ſhal be an occaſion of great reioycyng amongſt the people. And they ſhall bee deliuered from captiuitie and wicked ſuperſtition. The ſickenesses ſhal be ſomewhat moze moderate & conſtant, than heretofore in this yeare, meaning the grace of God.

The full Moone ſhal be the .xviij. day at .v. of the clocke. .xxi. minutes in the moorning, conſtante and moderate weather, but it ſhall not long continue, but rather return to his former malignitie: as cold ſnow, wynd, froſtes, rayn, not without ſome ſuch token or ſigne, as heretofore hath not bene ſene. Within this moneth ſhall bee (what by thunders and other inconuenient ſeaſons) quaterne agues, coughes, pleureſies, the grauell and ſtone, namcly to the aged. The raines ſhall be very troubleſom.

The

A Prognostication

The fluddes shall mightily increase & ouerrunne many landes and places, and therby do great hurt and damage.

The last quarter shall be the .xxii. day at .viij. of the clock .xxxv. minutes at after none, great rain, soze windes, mistes, snowes, frostes abundant and incomparable. True it is, that on the .xxix. daie of this moneth, it shall somewhat begyn to be seasoned and moderated, very mystie and foggy: but at the latter end very constant & moderate wether.

The new Moone shall be the .xxx. daie at .xi. of the clocke .xxiiij. minutes in the moorning, moderate weather, great corruptions in the ayre, and very reumatike, whiche will cause certayne vnknown sicknesses. Lette vs pray vnto God to preserue vs this yeare from all calamitie, and from all suche maner of diseases.

Here endeth the Prognostication of the .xii. monethes for this present yeare. 1567.
